

Cyber Sense AI - Project Overview & User Stories

Project Goal

Cyber Sense AI predicts human cyber behaviour risks before cyber incidents occur. The system analyses different cybersecurity risks, provides Explainable AI (XAI) predictions, calculates an overall cyber risk score, and offers personalized cybersecurity coaching.

Actors

1. **Visitor:** Potential users exploring the platform.
2. **Registered User:** Active users performing risk analyses.
3. **AI Prediction Engine:** The core logic processing data and generating insights.
4. **Administrator:** Platform managers overseeing users and system performance.

User Stories

Visitor

- **Learn:** As a visitor, I want to learn about Cyber Sense AI, so that I understand how it predicts cyber risks.
- **Explore:** As a visitor, I want to explore the platform features, so that I know what cybersecurity risks can be analysed.
- **Register:** As a visitor, I want to register an account, so that I can use AI-powered cyber risk analysis.

Registered User

- **SMS Analysis:** As a user, I want to upload or paste SMS messages, so that Cyber - Sense AI can detect phishing SMS.
- **Email Analysis:** As a user, I want to upload suspicious emails, so that Cyber Sense AI can identify phishing emails.
- **URL Scanning:** As a user, I want to scan URLs, so that I know whether a website is malicious or safe.
- **Auth Behaviour:** As a user, I want Cyber Sense AI to analyse my authentication behaviour, so that unusual login activities can be identified.
- **Behavioural Monitoring:** As a user, I want Cyber Sense AI to monitor behavioural changes, so that increasing cyber risks can be detected early.
- **Risk Score:** As a user, I want an overall cyber risk score, so that I understand my cybersecurity posture.

- **Explainable AI:** As a user, I want Explainable AI explanations, so that I know why a prediction was made.
- **Coaching:** As a user, I want personalized cybersecurity recommendations, so that I can reduce my cyber risks.
- **History:** As a user, I want to view my previous analyses, so that I can track improvements over time.
- **Reports:** As a user, I want downloadable cyber risk reports, so that I can review my security history.

AI Prediction Engine (System Stories)

- **SMS Classification:** As the AI Prediction Engine, I want to classify SMS messages, so that phishing SMS can be detected.
- **Email Classification:** As the AI Prediction Engine, I want to classify emails, so that phishing emails can be identified.
- **URL Evaluation:** As the AI Prediction Engine, I want to evaluate URLs, so that malicious websites can be detected.
- **Password Risk:** As the AI Prediction Engine, I want to calculate password risk, so that weak credentials can be identified.
- **Drift Detection:** As the AI Prediction Engine, I want to detect behavioural drift, so that abnormal user behaviour can be recognized.
- **Aggregation:** As the AI Prediction Engine, I want to combine all individual risk scores, so that an overall cyber risk score can be generated.
- **XAI Generation:** As the AI Prediction Engine, I want to generate Explainable AI outputs, so that users understand every prediction.

Administrator

- **User Management:** As an administrator, I want to manage users, so that platform access is secure.
- **System Stats:** As an administrator, I want to monitor overall system statistics, so that cybersecurity trends can be analysed.
- **Model Management:** As an administrator, I want to manage AI models, so that prediction accuracy improves over time.
- **Org Reports:** As an administrator, I want to generate reports, so that organizational cybersecurity insights can be obtained.
- **Trend Monitoring:** As an administrator, I want to monitor phishing, malicious URL, password, and behavioural risk trends, so that proactive cybersecurity measures can be implemented.
